

Submission 132 – Confidential

I believe that RemoteID would have a negative impact on the RC drone hobby and would put the privacy of pilots in danger.

RC drones are a popular hobby for people of all ages. They are used for a variety of purposes, including photography, videography, and racing. RemoteID would make it much more difficult to fly RC drones in public spaces. This is because RemoteID would require drones to be equipped with a transmitter that would broadcast their location and identification information. This information could be easily intercepted by malicious actors, who could use it to track and target drone pilots.

In addition, RemoteID would be a privacy invasion for drone pilots. The information that would be broadcast by RemoteID devices would include the pilot's name, address, and phone number. This information could be used by criminals to track down and harass drone pilots.

I urge you to reconsider the proposed RemoteID requirements. RC drones are a harmless hobby that brings joy to people of all ages. RemoteID would make it much more difficult to fly RC drones and would put the privacy of pilots in danger.
