

## Submission 57 – Graeme Molineux

I object to the use of delivery drones for purely commercial operations. I have no objection to the use of drones for essential services and medical aid purposes.

The air over our heads and homes is the one last free space left to us that is not cluttered with advertising and commercial deliveries. I do not wish to have my peace and quiet, and the sanctity of my home, invaded by the whine of frequent drone deliveries.

I am also extremely concerned over the possible invasion of privacy such drone flyovers could represent. These machines all have cameras and they will no doubt be flying over my home. There is no guarantee any footage is not being recorded and there is the possibility of this recorded information even being used to scout for burglaries or similar offences.

Another serious safety concern I hold is what will happen when these machines fail and end up falling into traffic, peoples homes, public spaces etc.

I feel the reasoning around 'last kilometer of the delivery chain' being the most environmentally damaging is seriously flawed.. This supply of delivery drones would need to be manufactured, delivered and recharged, all using resources. I see the use of delivery drones, particularly for delivery of fast food, is simply a way for the deliverers to make more money and it encourages consumer laziness.
